1. This communication is in response to the amendment filed on 04/20/05.

The arguments to Claims 1-4 have been fully considered and have overcome the rejection under 35 U.S.C. 102(b) as being anticipated by Bunch, "Fundamental Microsoft Jet SQL for Access 2000".

Bunch remains the closest art of record.

#### **Reasons for Allowance**

2. Claims 1-4 are allowed.

Prior art of record, Bunch, disclose a language that is used to extract, manipulate and structure data that resides in a relational database. The language appears to be used for facilitating user entities in a relational database application program, which includes a plurality of Data Manipulation Language statements (Page 6) run under a database management system. Bunch provides accessing database tables organized as rows of defined columns. The Data Manipulation Language statements include SLECT statement to retrieve data from database tables to create a set of records made up any number of fields or columns. Bunch discloses "using SQL in Access", where the set of records can be inserted into database tables, and thus could provide facilitating a development. However, Bunch lacks and does not disclose using the language to facilitate development and testing as augured by Applicants. Applicants point out that the whole section "using SQL in access" absent from the combination of Claim 1.

Therefore, the following is an examiner's statement of reasons for allowance: The cited prior arts taken alone or in combination fail to teach claimed invention as a method for facilitating the development and testing by a plurality of individual user entities, of a relational database application program which includes a plurality of Data Manipulation Language statements, which runs under a database management system and which accesses original database tables organized as rows of defined columns, the method comprising combination features,

*"to create a corresponding new table within which are defined the same columns that are defined in the original database table, and which includes an additional column that is defined to include a User*

*Identification, and to define a view created having the same name and column definitions as the corresponding original database table, where the view Selects only the rows in the new table in which the User Identification matches a particular user entity; and for each particular user entity, allowing access to the view created by a match of the User Identification with the particular user entity for executing Data Manipulation Language statements of the application program, including statements to insert rows, without modification of the statements of the application program other than for purposes of developing and testing functionality of the application program” as recited in Claim 1.*
